

THE TORONTO PROMPT

The complete production loop — brand → website → tattoo artwork → keynote deck

Chris Corey · KitFire · kitfire.ai

Given away at "Claude for Founders & Entrepreneurs," Toronto · July 30, 2026

You watched a finished thing on stage: a premium tattoo-studio website with a drag-to-reveal gallery, a working booking calendar, an animated SVG logo, and a keynote deck about how it was made. This document is the whole loop that produced all of it — verbatim, in order, with the guardrails that kept it usable and the two places it broke.

The live output: <https://kitfire.ai/toronto/>

Take it, change the industry, run it. That's the point.

0 · WHAT ACTUALLY RAN IT

Be honest about the stack, because the loop depends on it:

Layer	What it was	What it did
Operator / orchestrator	Claude Code (Opus)	Ran the whole loop. Wrote every file, held the brand decisions across stages, dispatched the image work to a subagent, optimized the images, wired them into the page, deployed the site, and edited the deck.
Image generation	ChatGPT (GPT-5.6), driven through a browser MCP with a logged-in Chrome	Generated the eight tattoo artworks. Claude Code wrote the prompts and drove the browser; ChatGPT drew.
Deck	Claude Design	Took a written design brief and produced the 14-slide keynote.
Host	GitHub Pages	The finished site, published to a live URL.

The pattern under the stack — this is the part that transfers: one model is the *operator* and never hands the job back to you. When it needs a capability it doesn't have, it dispatches to a tool or

another model, takes the result, and keeps going. You are not in the middle of that.

If you only have a chat window, everything below still works — you just paste the stages yourself and download the images by hand. The loop is the same; the labour is yours instead of the agent's.

1 · THE THREE LOOP SHAPES

Everything below is built out of three moves. Learn these and you can write your own.

The Chain Loop — one prompt, numbered stages, each stage consumes the output of the one before it. The finish line is written into the prompt so the model never stops to ask permission.

The Fan Loop — the same prompt run across N targets. One studio becomes every studio in the county. The prompt is the product; the input list is the volume.

The Critique Loop — the output goes back in, judged against a bar you stated in advance, and is revised until it passes. Almost nobody runs this pass. It is where the quality difference lives.

The four operator rules that make all three work:

1. **Name the finish line.** "Do all parts and keep going until every part is finished."
2. **Guardrail once, at the top** — not renegotiated every turn.
3. **Forbid the stall.** A prompt that *can* end in a question *will* end in a question.
4. **No invented facts.** Real, verifiable data only. Fabrication is what makes AI output

unusable in a real business — it's a rule, not a preference.

2 · THE MASTER PROMPT

Paste this into Claude Code (or Claude with tools). Fill in the three inputs at the bottom.

```
=== BEGIN MASTER PROMPT ===
```

```
You are my creative director, web developer, art director and deck writer. I am giving  
you  
three inputs. From those alone, produce a complete brand launch: a premium website, an  
original artwork set, and a keynote deck about how you built it.
```

Work through ALL SEVEN STAGES below, in order. Each stage consumes the output of the stage before it. Do not stop between stages to ask whether I want you to continue – I have already said yes by sending this. Finished means all seven stages are done and every file exists on disk.

STAGE 1 – INVENT THE BRAND

From the three inputs, invent one fictional business. Decide and write down, in a short brand

sheet I can read in 30 seconds:

- Name (memorable, ownable, not a pun, not two words jammed together)
- One-line positioning promise – what it says on the door
- Voice: five adjectives, and three sentences written in that voice
- Palette: 5 hex values with a role for each (ground, surface, primary text, muted text, accent)
- Type direction: a display face role and a UI face role, described by feel
- Placeholder contact details that are OBVIOUSLY fictional – use a 555 phone number, a non-routable email, and a street address that does not exist

Every later stage inherits this sheet. Do not re-decide the brand later.

STAGE 2 – DESIGN THE MARK

Draw the logo as `INLINE SVG`, by hand, in code. Not a generated raster image.

Reasons this is a rule: it stays sharp on a projector at any size, it costs nothing to re-colour, and it can be animated in CSS. A PNG logo can do none of that.

Deliver a compact SVG mark (under ~40 lines) plus a CSS animation that gives it one small sign of life – a flicker, a pulse, a slow rotation. Restraint: one idea, not five.

STAGE 3 – BUILD THE WEBSITE

One self-contained `index.html`. All CSS and JS inline. No frameworks, no build step, no external requests of any kind – no font CDNs, no analytics, no icon libraries. It must open correctly from a USB stick on a laptop nobody has configured.

Sections, in this order:

1. Fixed nav that changes state on scroll, with the Stage 2 mark
2. Full-viewport hero – headline, one-line promise, two calls to action
3. A scrolling marquee of what the business does
4. About – real, specific copy in the Stage 1 voice
5. GALLERY – see Stage 4/5, this is the centrepiece

6. The people – four of them, each owning one specialism
7. Process – four steps, plainly written
8. A working booking calendar – see below
9. FAQ accordion – five questions a real customer actually asks
10. Directions – a hand-drawn SVG map with an animated location pin, plus parking and transit
11. Footer, including a visible notice that this is a demonstration build for a fictional business

The booking calendar must actually work as a UI: build the current month from real date logic, start the week on Monday, strike out past dates and the day the business is closed, mark some days fully booked, and let a click select a day. Selecting a day reveals time slots – some shown as taken. Selecting a time updates a live summary line. A submit button produces a confirmation card. It sends nothing anywhere and stores nothing.

Animation is part of the brief, not decoration on top of it. Include at minimum: a headline that rises out of a mask on load, staggered scroll-reveal via IntersectionObserver, a hover-fill on buttons, an accordion, and one atmospheric background effect built from CSS or inline SVG only. Do NOT gate any of it behind prefers-reduced-motion – this page is being presented on a machine whose reduced-motion setting is unknown, and a flat page is a failed demo.

Copy rules: write real, specific sentences for THIS business. No lorem ipsum. No invented statistics, no fabricated reviews, no earnings or results claims. If a section wants a number you have not been given, write the sentence without the number.

STAGE 4 – ART DIRECT THE GALLERY

The gallery needs four original artworks, each in a DIFFERENT style, chosen to show range rather than taste. Write the image prompts yourself – do not ask me what to draw.

Produce EIGHT prompts: for each of the four pieces, one STENCIL OUTLINE and one FINISHED COLOUR version of the same design. They are paired so the website can wipe between them.

Write one "house frame" paragraph and prepend it to all eight, fixing: flat presentation on paper, centred with an even margin, square 1:1, ultra high definition, and an explicit negative list – no text, no lettering, no watermark, no signature, no hands, no skin, no mockup framing.

Then write each prompt to about 60-90 words. Name the subject, the pose or angle, the specific stylistic tradition, the framing elements, and – for the outline – say "pure outline

only, no shading, no colour, no fill" explicitly, because models drift toward shading.

STAGE 5 – GENERATE AND INTEGRATE

Generate the eight images.

If you can drive a browser: open the image tool in a logged-in session and work in FOUR separate conversation threads, one per piece. In each thread generate the OUTLINE first, then ask for the colour version as a FOLLOW-UP IN THAT SAME THREAD – that is what makes the two register against each other. One at a time. Never open parallel tabs against one browser.

If you cannot drive a browser, output the eight prompts as a numbered list for me to run, and continue to Stage 6 rather than stopping.

Then integrate, without being asked:

- Down-convert to web-weight JPEG (longest edge ~1400px, quality ~90, progressive). A gallery of full-size PNGs is 20MB and will stall on conference wifi.
- Keep the originals in a separate folder.
- Wire each pair into a DRAG-TO-REVEAL slider: colour underneath, outline on top clipped by a percentage, a visible handle, pointer AND touch events, and a one-time automatic sweep when the piece scrolls into view so a viewer discovers the mechanic without being told.
- Give every image a real alt attribute.
- Put a styled fallback behind each frame so a missing file still looks intentional.

STAGE 6 – WRITE THE KEYNOTE

Now write the deck ABOUT what you just built – a design brief complete enough that a design tool can produce the slides without asking a single question.

It must specify: the audience and their current habit; the one-line thesis; a section per loop shape (chain, fan, critique); the four operator rules as a recurring motif; the worked example running through the whole thing; the actual prompt text on screen, annotated with what makes it a loop; a failure-modes slide; a fill-in-the-blank skeleton the room can copy off the screen; and a closing slide.

Design direction to state explicitly: dark and high-contrast; legible from the back row of a conference room on a washed-out projector; type does the work; no stock photography and no glowing-brain AI imagery; prompt text set as a first-class design element in monospace,

not
dumped as a code block; one idea per slide; 16:9; presenter notes on every slide written
in
my voice.

STAGE 7 – THE CRITIQUE PASS

Do not deliver yet. Review everything you just made against this bar, then fix what fails:

- Does the site open and run correctly with NO network connection at all?
- Does the booking calendar produce a correct month, and does clicking actually do something?
- Does every image load, and does every slider wipe in both directions on touch and mouse?
- Is there a single sentence of filler, lorem ipsum, invented statistic, fake review, or results claim anywhere on the page? Delete it.
- Is any placeholder syntax still visible – [brackets], (verify), TODO, TBD? Bracketed placeholders RENDER AS TEXT and are the single most common way a demo embarrasses you.
- Would the deck's prompt slide be readable from 40 feet away?
- Is it obvious to any viewer that the business is fictional?

Report what you changed in the critique pass. If nothing failed, say so plainly – do not invent a fix to look thorough.

GUARDRAILS – these hold across all seven stages

- Real, verifiable data only. Invent the FICTIONAL BUSINESS freely; never invent a fact about the real world, a statistic, a review, or a result.
- No earnings, income, or results claims anywhere, in any stage.
- Never enter credentials, never sign into anything, never accept terms on my behalf. If a tool needs a login, stop and tell me – that one step is mine.
- Deploy nothing to a live domain without telling me the exact URL first.
- If a stage genuinely cannot be completed, finish every other stage in full and tell me plainly which one you could not do and why. Do not substitute something else and stay quiet about it.

MY THREE INPUTS →

Industry: [e.g. tattoo studio]

City: [e.g. Flint, Michigan]

Character: [the feeling – e.g. premium, private, appointment-only]

=== END MASTER PROMPT ===

3 · THE FAN VARIANT

Same prompt, run across a list instead of a single input. Append this and supply the list:

```
Run the master prompt above once per row in the list below. Keep the loop structure identical; change only the three inputs. After every run, append one line to a results table: business name, one-line positioning, the four gallery styles you chose, and the output folder. When all rows are done, review the table and tell me which three came out strongest and why – I only want to develop those.
```

That last sentence is a **critique loop nested inside a fan loop**, and it's what stops the fan from producing forty mediocre things instead of four good ones.

4 · WHERE THIS LOOP ACTUALLY BROKE

Two failures, both real, both worth more than the successes:

1. The image tool was logged out. The agent opened the browser, found no session, and stopped — correctly. It did not try to sign in, and it did not fabricate the eight file paths to appear successful. One human action unblocked the whole thing. → *The lesson: build the stop into the prompt. "If a tool needs a login, stop and tell me" is why this failed safely instead of failing silently.*

2. One colour pass came back as a redraw, not a recolour. The samurai's colour version has the same composition and framing as its outline, but the figure is heavier and the mask is more demonic. Three of four registered tightly; one did not. → *The lesson: same-thread follow-up generation improves registration a lot, but does not guarantee it. If you need pixel-exact pairs, plan a verification step — or accept the drift and choose a reveal that doesn't depend on perfect alignment.*

A loop that reports its own failures is worth more than one that reports a clean run. Ask for that explicitly, because the default is to sound successful.

5 · TRY IT TONIGHT — THE SKELETON

If the master prompt is too much for a first go, this is the whole idea in nine lines:

You are my [role]. Do all THREE parts below, in order, and keep going until every part is finished. Do not stop between parts to ask if I want you to continue.

PART 1 – [the raw work]

PART 2 – [something that can only be built from Part 1's output]

PART 3 – [something that can only be built from Part 2's output]

RULES: real, verifiable data only · no invented statistics or reviews · no questions back to me · finished means all three parts are done. Then review your own output against [your bar] and revise it until it passes.

MY INPUTS → ___ · ___ · ___

The two lines almost everyone leaves out are the *last* one in the rules block and the "do not stop to ask" clause. Put them in and watch how much further it goes on its own.

Chris Corey · Founder, KitFire · kitfire.ai Built with Claude Code, ChatGPT over a browser MCP, and Claude Design. Live demo output: <https://kitfire.ai/toronto/>

If you build something with this, I'd genuinely like to see it — reply to this email.
